

A manual of spherical and practical astronomy Volume 2 ; embracing the general problems of spherical astronomy, the special applications to nautical ... fixed and portable astronomical instruments

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1864 Excerpt: ... To take the simplest case, let us suppose the sight line to be determined by a fixed horizontal thread (at right angles to the transit threads). Let this thread be brought into coincidence with its reflected image. The sight line is then vertical, and the reading of the circle (by which we always understand the mean of all the microscopes added to the degrees and minutes under the first microscope, or microscope A) represents the nadir point of the circle. Let this reading be denoted by C_0 . The telescope being then directed towards a star, and the fixed horizontal thread being made to bisect the star at the instant of the transit over the middle vertical thread, let the circle reading be C . Then the apparent nadir distance of the star, which I shall denote by N , will be $N=c-a$ and, for this purpose, it is advisable to make the piers sufficiently high and broad to protect the whole circle; for, since the temperature of the piers will often differ from that of the circle, the radiation from them will tend to produce unequal temperatures in the different parts of the circle, unless the latter is equally exposed to this radiation throughout. But even this arrangement will fail of its object if the temperature of the piers is not uniform; and therefore they must be protected against fluctuations of temperature as much as possible; for example, by first coating them with oil or some other preparation to exclude moisture, then wrapping them in cloth, and finally encasing them in wood, as proposed by Dr. Gould for the meridian circle of the Dudley Observatory. and this distance is usually reckoned from 0 to 360 from the nadir, through either the south point or the north point, according to the direction in which the graduations increase.

This direction is differ...
