

Climate Change: Developing Southern Hemisphere Perspectives (Research & Developments in Climate & Climatology)

Integrating issues of climate modelling, ecological and human dimensions of climate change, and policy implications, this volume addresses the critical problems of climate change from a Southern Hemisphere perspective. However, the spatial focus in the book is not defined just by latitude, but also by geopolitical criteria: encompassing the developing world, the tropics north of the equator, as well as regions south of the equator. The book begins by examining the geographic and geopolitical plurality of the Earth, including north and south distinctions and the science/policy plurality. A hemispheric perspective on coupled climate modelling is then discussed, providing a state-of-the-art summary of climate modelling as it pertains to the Southern Hemisphere. In addition, the book examines the interaction of humanity, the biosphere and the atmosphere, discussing the biospheric effects of climate change, possible climatic impacts of biospheric change, particularly tropical deforestation and the human health implications of climate and climate change.
