

Comprehensive Organometallic Chemistry III: Volume 7: Group 9

This volume reviews the theory, preparation, properties, reactions and special applications of group 9 organometallic compounds. Each chapter concentrates on either Cobalt, Rhodium or Iridium and examines the complexes formed between the metal and specific ligands. It provides a clear and comprehensive overview of developments since 1993 and attempts to predict trends in the field over the next ten years. Like its predecessors, COMC (1982) and COMC-II (1995), this new work is the essential reference text for any chemist or technologist who needs to use or apply organometallic compounds.* valuable content available May 2009 as an individual volume * separate volumes will appeal to a wider chemistry and materials science audience * priced for individual researcher as well as library purchase
