

Practical methods of electro-chemistry

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1905 Excerpt: ...substances. The apparatus consists of a platinum cathode, A, hung in a glass cylindrical vessel, B, which is open at the end and fits into a Pukal porous cell, D. The porous cell is surrounded by the anode, and stands in an outer vessel, E. The upper portion of the cylinder B is open, and has a ground neck for the insertion of the drying-tube c, which is filled with anhydrous calcium chloride and also carries the funnel, which is fitted with a tap, through which the solution to be tested can be run in. A capillary tube, G, is connected on to the end of the calcium chloride tube c. The middle of the capillary tube is 1 Quart, *fourn. Chem. Soc.*, 1861, 13, pp. 12 and 338. 2 *Journ. Chem. Soc.*, 1903. heated by means of the small bunsen burner H, and is surrounded where the flame heats it with a piece of platinum or iron wiregauze, to prevent the tube being fused. The whole apparatus is placed in a vessel, F, containing cold water, to prevent undue heating during electrolysis. Method of Working.--The apparatus is carefully washed with distilled water. The outer cell E is filled with dilute sulphuric acid, 30 per cent. Then the dilute sulphuric acid is run into the porous cell by means of the funnel. (The porous cell should be soaked in dilute sulphuric acid for about half an hour before being used.) As soon as all the connections are made, the bunsen burner is placed in position, but not lighted, and the current is passed. A current of about 5 amperes should be used, because then the escaping hydrogen issues at sufficient speed to produce a flame of about 3 mm. in size. As soon as all the air has been driven out, which usually occupies about ten minutes, the issuing hydrogen is ignited and the bunsen burner lighted. If after about fifteen

minutes no brown ring mak...
